‘I opted for natural vision after cataract surgery’

‘What will you choose?’

ask your ophthalmologist

Precizon
Aspheric Presbyopic IOL
Natural Vision

After your cataract surgery you will be able to see at different distances without glasses.

“ I was forever putting my glasses on and off during meetings and presentations at work. That has come to an end thanks to my Natural Vision”
What will you choose?

Glasses

You will need glasses for most viewing distances after your cataract surgery.
You’ve been diagnosed with **cataract** and now you are facing **cataract surgery**

**What happens during cataract surgery?**
During cataract surgery the natural lens of your eye affected by cataract will be removed.

After removal, during the same surgery, an **artificial lens will be implanted** into your eye.

This lens takes over the functions of your natural lens and you will see better again. Whether you will need glasses after surgery depends on the **type of artificial lens that is implanted**.

**Types of Artificial lenses**
You can choose from different types of artificial lenses.

- **Premium lenses**;
lenses with specialized optics. You will be less dependent on glasses after cataract surgery.

- **Standard lenses**;
lenses with standard optics. They only offer clear vision at one distance, either near or far. This means you will be dependent on glasses.
Precizon Presbyopic Premium lenses

You will be able to see at different distances without glasses.

Standard lenses

You will need glasses for most viewing distances.
How often do you wear glasses after your Precizon Presbyopic implantation?

- Never: 80%
- Occasionally: 18%
- Quite often: 2%
- Very often: 0%
